The sharp images of the MRIs let scientists see how a particular swine breeding line looks—in terms of fat-to-lean ratio, or how a particular diet is affecting an animal's body. In the background, animal geneticist Armin Scholz monitors the pig within the MRI chamber.

Challenges and Opportunities of Ultra-High Field MRI and MRS

John C. Gore, Ph.D.

Vanderbilt Univ. Institute of Imaging Science

The development and applications to human subjects of magnetic resonance imaging systems at fields of 7 Tesla and above provide many new opportunities and technical challenges. The increased signal strength at higher fields enables higher resolution images to be acquired, which provides new insights into the structural anatomy of the brain. Specific contrast mechanisms such as those originating from the susceptibility of blood or chemical shift differences are enhanced at higher field, permitting novel information on e.g. chemical composition, pH or blood oxygenation to be derived with greater sensitivity. High resolution spectroscopy also benefits from the greater spectral dispersion at high fields, so that measurements of brain metabolites and neurotransmitters can be made with greater accuracy. These benefits have been realized in studies of brain structure and function including functional studies of neural connectivity. However, high field MR imaging is also affected by macroscopic field variations caused by inhomogeneities of magnetic susceptibility within the body, and these degrade spectra and introduce image distortions. Moreover, the performance of radiofrequency (RF) coils is also affected at higher fields, and it is more difficult to create uniform RF fields within large objects. These challenges are being met using various technical innovations such as dynamic shimming, the use of parallel arrays of coils, novel spectral-spatial excitation methods, novel pulse sequences and post-acquisition digital processing. In combination these efforts promise to allow ultra-high field imaging and spectroscopy to achieve their full potential.

John C. Gore, Ph.D., is Director of the Institute of Imaging Science and Chancellor's University Professor of Radiology and Radiological Sciences, Biomedical Engineering, Physics and Molecular Physiology and Biophysics at Vanderbilt University. Dr. Gore obtained his Ph.D. in Physics at the University of London in the UK in 1976 and has been an active leader in imaging research and applications for over 30 years. He also holds a degree in Law. He is an elected fellow of the American Institute of Medical and Biological Engineering, the International Society for Magnetic Resonance in Medicine (ISMRM), and the Institute of Physics (UK). In 2004 Dr. Gore was awarded the Gold Medal of the ISMRM for his contributions to the field of magnetic resonance imaging. He has served twice as a trustee of the ISMRM and is editor-in-chief of the journal Magnetic Resonance Imaging. He founded the pioneering MRI research program at Hammersmith Hospital in the UK in the late 1970's prior to establishing and directing the MRI research program at Yale University from 1982-2002. He has published over 400 original papers and contributions within the medical imaging field. His research interests include the development and application of imaging methods for understanding tissue physiology and structure, molecular imaging and functional brain imaging.

The Grants Process at NIH

Sunday 17 February · 5:45 to 7:45 pm · Royal Palm I-III Room

Moderator: **Xiang-Ning Li**, Ctr. for Scientific Review NIH/HHS

The National Institutes of Health (NIH) is a major source of basic research support to academia and industry for the development of new technology for medical imaging. At the 2007 Medical Imaging meeting, representatives of two of the top funding institutes presented details of their areas of interest and new directions in imaging technology. However, to get support, one must prepare a grant application and the art form of preparing such an application and how they are evaluated at NIH remains a mystery to many. The process of evaluation is called Peer Review and is the means by NIH is able to evaluate and select the best science for funding, and in turn provide constructive feedback and guidance to those who are not successful.

This planned session at the SPIE Medical Imaging meeting will focus on two points, the art of grantsmanship and how grant applications are evaluated through peer review. Members of the SPIE Medical Imaging community will provide thoughts and insights into the preparation of applications for NIH support, and an NIH representative who manages grant reviews for imaging technology will speak on the process of peer review. Finally, a mock study section will be conducted to show the specifics of how discussions go and what type of details are required.

The objective of this workshop would be to provide some idea of the grantsmanship effort and what NIH study section reviewers are looking for in a successful grant application. One speaker will be a senior member of the academic community who are also successful grantees with previous experience in review as a permanent member and past chair of the Biomedical Imaging Study Section. In addition, for those in the private sector in small businesses, a second talk will involve the process by which they can also apply for grant support under the Small Business Innovative Research Program. Discussions will include what considerations are important in preparing a grant application, in amending one, and with new issues in human subjects and budgets.

The academic speaker will be Erik Ritman, M.D., Ph.D, Professor, Department of Physiology and Biomedical Engineering, Mayo Clinic, Rochester, New York on considerations of preparing an application for basic research and on revising an initially unsuccessful one. In addition, David Vilkomerson, President, DVX, LLC, Princeton, New Jersey, will speak on preparing applications for small business research support and the differences between a SBIR and basic research application.

There will also be a Monday morning session that will provide an opportunity to meet with representatives of Center for Scientific Review and several of the main imaging technology funding Institutes of NIH on a one-on-one basis to ask specific individual questions.

Content-Based Image Retrieval: Major Challenges for Medical Applications

Tuesday 19 February · 5:45 to 7:45 pm · San Diego Room

Moderators:

Thomas Deserno, Aachen Univ. of Technology (Germany)
L. Rodney Long, National Library of Medicine/NIH,

Panelists:

Sameer Antani, National Library of Medicine/NIH
Hayit Greenspan, Tel-Aviv Univ. (Israel)
Agma Traina, Univ. of São Paulo at São Carlos (Brazil)
Henning Mueller, Univ. and Hospitals of Geneva (Switzerland)

Papers published in the technical literature regularly report on experimental implementation of Content-Based Image Retrieval (CBIR) algorithms and prototype systems, yet the use of CBIR technology for either biomedical research or clinical routine appears to be very limited. While there is widespread enthusiasm for CBIR among the engineering research community, the incorporation of this technology into the solution of practical medical problems is a goal yet to be realized. The obstacles to the use of CBIR in medicine include

- the lack of effective collaborations between medical and engineering experts;
- the lack of effective representation of the medical content by low-level mathematical features;
- the lack of thorough evaluation of CBIR concepts;
- the lack of appropriate tools for medical experts to experiment with a CBIR application;

This workshop aims to bring together CBIR researchers in a forum to present an overview of where we stand on moving CBIR into practical biomedical use, with the goal of creating new synergy between the medical and engineering communities for the use of this technology.

Meet the FDA

Tuesday 19 February · 5:45 to 7:45 pm · Royal Palm I-III Room

William M. Sutton, CDRH/Food and Drug Administration

FDA's Center for Devices and Radiological Health (CDRH) is responsible for ensuring the safety and effectiveness of medical devices and eliminating unnecessary human exposure to man-made radiation from medical, occupational and consumer products. There are thousands of types of medical devices, from heart pacemakers to contact lenses. Radiation-emitting products regulated by FDA include microwave ovens, video display terminals, and medical ultrasound and x-ray machines. Attendees to this session will learn about device classification, registration and listing, premarket notification [510(k)] and premarket approval (PMA). The regulatory requirements of the Electronic Product and Radiation Controls (EPRC) will also be covered during this session. In addition, the new device provisions of the FDA Amendments Act (FDAAA) of 2007 will be discussed.

William (Bill) Sutton has been employed by the Food and Drug Administration (FDA) for over 23 years. He has been a consumer safety officer in the Center for Devices and Radiological Health's (CDRH's) industry and international assistance program since 1995 and currently serves as the Deputy Director. Prior to joining the Division of Small Manufacturers, International and Consumer Assistance (DSMICA), he served 12 years in the Office of Device Evaluation. His primary duties were to perform preliminary reviews of medical device applications. Since 1998, Mr. Sutton has done extensive work with the International Relations Staff. This group facilitates commerce in medical devices by pursuing harmonization of regulatory requirements and by encouraging mutual recognition agreements between the U.S. and other countries.

DICOM Working Group 23 and Application Hosting: What They Mean for Research in Medical Image Analysis

Chair: David Haynor, Univ. of Washington

Speakers:

Lawrence Tarbox, Washington Univ. in St. Louis

Gianluca Paladini, Siemens Corporate Research

Chris Wood, Clario Medical Imaging

Laurence Clarke, National Cancer Institute, NIH

Getting raw images from local databases and archiving/displaying computed or parametric images is a complex process that greatly increases the difficulty of bringing methods of medical image analysis into the clinic. A standardized interface for these purposes would make it easier for researchers and vendors to introduce innovative methods into clinical practice. With this in mind, DICOM Working Group 23 was organized to explore the concept of Application Hosting, an environment that allows imaging applications function as plugins, greatly decreasing the problems of adapting applications to differing local environments. The working group has produced a specification for Application Hosting, and several groups are developing implementations of the specification that will be ready for distribution in early 2008. Dr. Lawrence Tarbox of Washington University, the chairman of Working Group 23, will give an overview of its goals and accomplishments to date, including an open source implementation of the specification. Speakers from Clario Medical Imaging and the NCI will survey commercial implementations of Application Hosting and the implications for medical image analysis in relation to patient care and oncology specifically.

Challenges in the computational modeling of living systems include understanding the nature of physiological occurrences, developing mathematical descriptions and/or constitutive relationships that reflect physical behavior, and developing methods to measure these events to produce model-validating frameworks. In the past, these challenges have been the predominant concerns within the biomedical modeling community. However, with the recent breakthroughs in CPU processing power and medical image processing, the concept of using patient-specific computer models apart from their predictive roles to that of a more integrated one within therapy guidance and medical imaging is rapidly becoming possible. In this workshop, the role of modeling within medical imaging will be discussed.

Two major x-ray-based techniques used for medical imaging are digital radiography (DR) and computed tomography (CT), both of which mainly use the intensity of x-ray flux to obtain gray scale images. Recently, there have been strong reviving research interests in an old concept: the use of the energy spectral information. Questions are then asked. What is new? Why now again? What are new techniques? What are potential clinical applications? In this interactive workshop, we will discuss various technical advances and clinical applications on dual- and multi-energy x-ray DR and CT imaging.

Chair: **Robert M. Nishikawa**, The Univ. of Chicago,

This year, 2008, marks the tenth anniversary of the first computer-aided detection (CADe) system approved for clinical use in the United States. While we are approaching approximately 50% of screening mammograms being read with computer assistance in the US, there is still controversy to whether the technology is beneficial. This is a result of two major problems: the difficulty in conducting clinical studies and the difficulty for radiologists to use CADe optimally. Measuring the benefits of CADe is difficult because the cancer prevalence is low, resulting in the need for large study cohorts (probably on the order of 100,000). Furthermore, clinical studies are subject to biases, variability in both radiologists' performance and patient populations, and methodological difficulties. As a result, there are conflicting results from the approximately ten studies that have been published to date. Underlying the clinical evaluations is the difficulty in training radiologists to use CADe effectively. The low cancer prevalence means that the number of cancers that a radiologist might miss each year is low, so the opportunity for radiologists to know that CADe has helped them detected a missed cancer is rare. Further, to learn how to correctly recognize computer false detections takes time, up to 2 years in one study. In this context, we need to develop useful training methods so that radiologists can use CADe to obtain the maximum benefit possible. In this session, the panel will address these issues and we will seek solutions from the within the panel and from the audience.

Image Perception, Observer Performance, and Technology Assessment

Conference 6917

San Diego Room · 1:20 to 3:00 pm

Recent Developments in ROC Analysis

Moderators:

Kevin S. Berbaum, Univ. of Iowa
Berkman Sahiner, Univ. of Michigan

Panelists:

Dev P. Chakraborty, Univ. of Pittsburgh
Darrin C. Edwards, Univ. of Chicago
Brandon D. Gallas, U.S. Food and Drug Administration

Philip F. Judy, Harvard Medical School and Brigham and Women's Hospital

Receiver operating characteristic (ROC) analysis has been around since the 1950's, and has been used in evaluating medical imaging systems since at least the 1970's. From an initial role as an evaluation method for an imaging system interpreted by a single observer, ROC and its extensions (LROC, FROC) have evolved into multi-reader, multi-case (MRMC), multi-modality tools that have the capability to analyze multiple location-specific marks per image. Along this continuing evolution, numerous research topics have been arising. In this workshop, a sampling of current research topics will be presented by the panelists.

After an introduction to ROC analysis and its extensions, discussion topics will include:

- Experiments and implications associated with asymmetric ROC curves
- Figures of merit for localization specific tasks
- Analysis and validation for localization-specific data
- Status of current analytical methods for localization data
- Probabilistic foundation to analyze and unify MRMC variance estimation methods such as the jackknife (DBM) and bootstrap
- Generalizing the variance methods for fully-crossed data to the missing data problem
- Current limitations of ROC and MRMC analyses
- Multi-class ROC analysis: Theoretical development and practical results under models that restrict the number of degrees of freedom.

Policies

Audio, Video, Digital Recording Policy

In the Meeting Rooms and Poster Sessions: For copyright reasons, recordings of any kind are strictly prohibited without prior written consent of the presenter in any conference session, short course or of posters presented. Each presenter being taped must file a signed written consent form. Individuals not complying with this policy will be asked to leave a given session and asked to surrender their film or recording media. Consent forms are available at the SPIE Audiovisual Desk.

In the Exhibition Hall: For security and courtesy reasons, photographing or videotaping individual booths and displays in the exhibit hall is allowed ONLY with explicit permission from on-site company representatives. Individuals not complying with this policy will be asked to surrender their film and to leave the exhibit hall.

Laser Pointer Safety Information

SPIE supplies tested and safety approved laser pointers for all conference meeting rooms, and for short course rooms if instructors request one. For safety reasons, SPIE requests that presenters use our provided laser pointers available in each meeting room.

If using your own laser pointer, have it tested at your facility to make sure it has <5 mW power output. Laser pointers in Class II and IIIa (<5 mW) are eye safe if power output is correct - but don't automatically trust the labeling. Commercially available laser pointers, red or green (or any color), could be incorrectly labeled as to their wavelength and power output.

Presenters intending to use their own laser pointer for presentations are required to come to the Audiovisual Desk onsite and test their pointer on our power meter. If the pointer fails the safe power level you may not use the pointer at the conference. You will be required to sign a waiver releasing SPIE of any liability for use of potentially non-safe laser pointers.

Use of a personal laser pointer at an SPIE event represents user's acceptance of liability for use of a non-SPIE supplied laser pointer device. Misuse of any laser pointer could lead to eye damage. In California, it is a criminal misdemeanor to shine a laser pointer at individuals "who perceive they are at risk."

Underage Persons on Exhibition Floor

For safety and insurance reasons, no persons under the age of 16 will be allowed in the exhibition area during move-in and move-out. During open exhibition hours, only children over the age of 12 accompanied by an adult will be allowed in the exhibition area.

No Suitcasing Policy

Suitcasing is the act of soliciting business in the aisles during the exhibition or in other public spaces, including another company's booth or a hotel lobby.

Please note that while all meeting attendees are invited to the exhibition, any attendee who is observed to be soliciting business in the aisles or other public spaces, in another company's booth, or in violation of any portion of SPIE Exhibition Policy will be asked to leave immediately. Additional penalties may be applied. Please report any violations you may observe to show management.

Unsecured Items

Personal belongings such as briefcases, backpacks, coats, book bags, etc. should not be left unattended in meeting rooms or public areas. These items will be subject to removal by security upon discovery.
