EAP ARTIFICIAL MUSCLE ACTUATORS FOR BIO-INSPIRED INTELLIGENT SOCIAL ROBOTICS

David Hanson

Hanson Robotics Ltd. (USA)

Abstract: Bio-inspired intelligent robots are coming of age in both research and industry, propelling market growth for robots and A.I. However, conventional motors limit bio-inspired robotics. EAP actuators and sensors could improve the simplicity, compliance, physical scaling, and offer bio-inspired advantages in robotic locomotion, grasping and manipulation, and social expressions. For EAP actuators to realize their transformative potential, further innovations are needed: the actuators must be robust, fast, powerful, manufacturable, and affordable. This presentation surveys progress, opportunities, and challenges in the author's latest work in social robots and EAP actuators, and proposes a roadmap for EAP actuators in bio-inspired intelligent robotics.

PLANT NANOBIONIC MATERIALS FOR THERMALLY ACTIVE, SOFT, ARTIFICIAL SKINS

Chiara Daraio

California Institute of Technology (USA)

Abstract: Bionic materials are a class of materials that aims to preserve, enhance, and exploit properties of living systems for engineering purposes. In most cases, however, creating synthetic materials that reproduce or surpass the performance of

natural materials has been elusive. We fabricate synthetic materials that combine carbon nanoparticles in a matrix of plant cells, to create new temperature sensors with record-breaking responsivity. We extract the active molecule, pectin, responsible for the temperature sensitivity in plants, to create ultra-sensitive, flexible membranes that can map temperature changes from a distance. These materials augment properties of synthetic skins for robotics and prosthesis, and can find applications in consumer electronics or NDE.

Biography: **Prof. Chiara Daraio** received her undergraduate degree in Mechanical Engineering from the "Marche" Polytechnic University, Italy (2001). She received her M.S. (2003) and Ph.D. degrees (2006) in Materials Science and Engineering from the University of California, San Diego. She joined the Aeronautics and Applied Physics departments of the California Institute of Technology (Caltech) in fall of 2006 and was promoted full professor in 2010. From January 2013 to August 2016, she joined the department of Mechanical and Process Engineering at ETH Zürich, with a chair in Mechanics and Materials. She resumed her professorship at Caltech in August 2016. She received a Presidential Early Career Award (PECASE) from the White House in 2012, was elected as a Sloan Research Fellow in 2011 and received an ONR Young Investigator Award in 2010. She is also a winner of the NSF CAREER award (2009), of the Richard Von Mises Prize (2008) and received the Hetenyi Award from the Society for Experimental Mechanics (2015). She was selected by *Popular Science* magazine among the "Brilliant 10" (2010). She serves as an Associate Editor for the journal *Extreme Mechanics Letters*. She published over 100 peer-reviewed papers, two book chapters and several patents (<http://www.mechmat.ethz.ch/index.html>).

PREDICTIVE SIMULATION OF STRUCTURAL HEALTH MONITORING

Victor Giurgiutiu

Univ. of South Carolina (USA)

Abstract: Predictive simulation of the structural health monitoring (SHM) process has a crucial role in the efficient design of effective SHM systems. Predictive simulation is part of the forward problem which calculates the sensor signals that would be recorded for a given structural state and a given excitation. The inverse problem, which is more difficult, has to estimate the structural state from known excitation and known measured signals. This inverse problem is usually solved through an optimization process in which the forward problem is run repeatedly for many times. A fast and accurate forward problem that has adequate sensitivity to damage presence while being insensitive to confounding factors is highly desirable for an efficient solution of the inverse problem. Several examples derived from work performed in the laboratory for active materials and smart structures (LAMSS) of the University of South Carolina, USA will be presented and discussed. The presentation will end with conclusions and suggestions for future work.

Biography: **Victor Giurgiutiu** is Professor of Mechanical Engineering at the University of South Carolina and Director of the Laboratory for Active Materials and Smart Structures (LAMSS). He is the author of Structural Health Monitoring with Piezoelectric Wafer Active Sensors (Elsevier Academic Press, 2nd Ed.) as well as other 6 books, 16 book chapters, and over 100 archival journal articles. He has recently completed his duty as chair of this SPIE Symposium on Smart Structures and NDE. He was recognized with Structural Health Monitoring Person of the Year Award 2003 and Nondestructive Evaluation Lifetime Achievement Award 2016. Fellow of the Royal Aeronautical Society (RAeS), Fellow of ASME, and Associate Fellow of AIAA. Special Issues Editor to the *Structural Health Monitoring - An International Journal* (Sage, UK). Associate Editor to the *Aeronautical Journal of RAeS*.

NDE FOR THE 21ST CENTURY: INDUSTRY 4.0 REQUIRES NDE 4.0

Norbert Meyendorf

Iowa State Univ. (USA)

Abstract: Industry 4.0 stands for the fourth industrial revolution that is ongoing at present. Industry 4.0 is a terminology preferred used in Europe to characterize the integration of production and communication technologies, the so called "smart factory".

The first industrial revolution was the mechanization of work. The second was mass production and the assembly line. While the third revolution was the computer integrated manufacturing, Industry 4.0 encompasses the complete networking of all industrial areas. Lowering costs and efficient in-time production will be possible also for low numbers of very unique parts for example by additive manufacturing (3D printing). A significant aspect is also quality and maintainability of these sometimes unique structures and components. NDE has to follow these trends, not only by adapting NDE techniques to the new technologies, but also introducing the capability of cyber systems into the inspection and maintenance processes. The requirements and challenges for this new technological area will be discussed. Chances for applications of new technologies and systems for NDE will be demonstrated online.

Biography: **Dr. Norbert Meyendorf** is professor in the Aerospace Engineering at the Iowa State University and deputy director of the Center for Nondestructive Evaluation in Ames, Iowa since January 2016. Before moving to Ames he was department head and branch director at the Fraunhofer institute for Nondestructive Testing in Germany for more than 20 years and Professor at the University of Dayton, Ohio and the University of Technology in Dresden, Germany for more than 10 years. He has edited several books, is author or coauthor of numerous journal articles and is editor in chief of the *Journal of NDE* published by Springer. He was chair of the SPIE symposium Smart Structures and NDE for 4 years and since 2001 every year chair or co-chair of a Conference within this symposium.

A SMART STRUCTURAL DYNAMICS STRATEGY FOR TESTING TOMORROW'S STRUCTURES

David J. Ewins

Imperial College London (United Kingdom)

Abstract: All structures for which dynamic behaviour is a primary consideration require application of advanced methods of both theoretical and experimental structural dynamics. Specifically, advances in predictive methods of simulation (especially in the numerical analysis aspects) can demand matching advances in testing to provide commensurate accuracy and coverage of the validation of their output. Acquisition of an improved prediction capability is usually accompanied by an increase in expectations and demands for greater reliability in the predicted behaviour. As a direct result, progress in testing and simulation must advance in step and improvements in testing can often be achieved by smarter implementation of contemporary test procedures based on interpretation of the more advanced models used for their design. This lecture presents an integrated test-analysis strategy for ensuring that next-generation structures of all types exhibit much improved reliability in their structural performance.

Biography: **David Ewins** studied at Imperial College London and at Cambridge University. He was based at Imperial throughout his career, as Professor of Vibration Engineering since 1983, working throughout his career in collaboration with Rolls-Royce. He also spent 8 years part-time at Bristol University and has been Visiting Professor in the USA, France, Switzerland and Singapore. He is a Fellow of the Royal Society, the Royal Academy of Engineering and the Society of Experimental Mechanics. He received the 2015 ASME Jacob P Den Hartog Award for lifetime achievements in Vibration Engineering.

ELECTROACTIVE POLYMERS FOR HEALTHCARE AND BIOMEDICAL APPLICATIONS

Siegfried Bauer, Johannes Kepler Univ. Linz (Austria)

Abstract: Electroactivity was noticed early in biological substances, including proteins, polynucleotides and enzymes, even piezo- and pyroelectricity was found in wool, hair, wood, bone and tendon. I will start the presentation with hydroxyapatite - a material full of surprises. Hydroxyapatite forms about 60 to 70 % of the mass of human and animal bone. In early investigations of piezo- and pyroelectricity in bone it was believed that the observed effects stem from the polar collagen component of bone, since hydroxyapatite was believed to be isostructural with the centrosymmetric apatite. Surprisingly later on a noncentrosymmetric structure was found, together with quite strong piezo- and pyroelectricity in this natural material. Although there is still a strong debate about the physiological importance of electroactive effects in biological materials, this example shows how widespread electroactive phenomena are in natural materials. Let's draw inspiration from nature

and widen the utilization of electroactive polymers towards (mobile) healthcare and biomedical applications. Ferroelectrets, internally charged polymer foams with a strong piezoelectric thickness coefficient are already employed in biomedical sensing, for example as blood pressure and pulse sensor, as vital signs monitor or for the detection of tonic-clonic seizures. Piezo- and pyroelectric polymers are booming in printed electronics research, providing electronic skin the ability to "feel" pressure and temperature changes, or to generate electrical energy from vibrations and motions, even from contractile and relaxation motions of the heart and lung. Dielectric elastomers on the other hand are pioneered by stretchsense as wearable motion capture sensors, monitoring pressure, stretch, bend and shear, quantifying comfort in sports and healthcare. On the cellular level, electroactive polymer arrays are used to study mechanotransduction of individual cells. Most recent efforts are devoted to implantable electroactive biomedical devices. Already with the currently available science and technology, we are at the verge of witnessing the demonstration of truly complex bionic systems. Without much doubt, the future of electroactive polymer materials is bright.

Biography: **Siegfried Bauer** studied physics at the University of Karlsruhe, where he graduated with the Master in 1986. In 1990 he received a PhD in physics from the same university. From 1992 - 1995 he was a senior scientist at the Heinrich Hertz Institute for Telecommunication Engineering in Berlin. In 1996 he received the Habilitation degree from the University of Potsdam. From 1997 -2002 he was an associate professor at the Johannes Kepler University in Linz, Austria; he became a full professor and head of the Soft Matter Physics Department in 2002. He is an associate editor of *Applied Physics Reviews* and a member of the editorial board of *Advanced Science*, *Advanced Materials Technologies*, *Applied Physics A*, the *IEEE Transactions on Dielectrics and Electrical Engineering* and *Proceedings A of the Royal Society*. He received several awards for his work, including the Karl Scheel prize of the Physical Society of Berlin in 1997, a pioneer of smart production award from the Austrian Society for Environment and Technology in 2010, and an ERC Advanced Investigators Grant in 2011. In 2016 he has been elevated to IEEE Fellow for contributions to the understanding and applications of electroactive polymer dielectrics. His research, published in more than 160 refereed scientific papers, centers on soft materials for sensors, transducers, flexible and stretchable electronics.

EPIDERMAL ELECTRONIC SYSTEMS FOR SENSING AND THERAPY

Nanshu Lu, The Univ. of Texas at Austin (USA)

Abstract: Epidermal electronics is a class of noninvasive, skin-conformable, stretchable sensors and electronics capable of continuous and long-term physiological sensing and clinical therapy. We have invented a cost and time effective, completely dry, benchtop "cut-and-paste" method for the green, freeform and portable manufacture of epidermal electronics within minutes. We have applied the "cut-and-paste" method to manufacture epidermal electrodes, hydration and temperature sensors, conformable power-efficient heaters, as well as cuffless continuous blood pressure monitors out of metal thin films, 2D materials, and piezoelectric polymer sheets. We will demonstrate four examples of our epidermal sensing and therapeutic devices in this talk.

Biography: **Dr. Nanshu Lu** received her PhD from Harvard and is now Assistant Professor at the University of Texas at Austin. Her research on stretchable and bio-integrated electronics have received more than 4000 citations and have brought her numerous prestigious awards such as TR 35, NSF CAREER, and YIP from AFOSR and ONR.

Tutorial: Applications of Uncertainty Analysis in Smart Materials and Adaptive Structures

Monday 27 March · 10:30 am to 3:00 pm

Location: Salmon

Instructors: **Ralph Smith**, North Carolina State Univ. (USA) and **William Oates**, Florida State Univ. (USA)

The purpose of this hands-on tutorial is to expose participants to statistical and numerical techniques that will allow them to quantify the accuracy of multi-physics models and simulation codes for active materials and structures when one accounts for uncertainty or errors in models, parameters, numerical simulation codes, and data.

In the first part of the tutorial, we will provide an overview of Bayesian statistics and numerical algorithms necessary to propagate input uncertainties through simulation codes. We will consider several case studies to illustrate these techniques for a variety of materials and smart structure applications. These include models for piezoelectric macro-fiber composites, shape memory alloys, viscoelastic polymers, graphene thermoacoustics, quantum-informed ferroelectric continuum models, and Rietveld analysis. In this part of the tutorial, we will provide participants with algorithms that quantify the uncertainties in model parameters, such as piezoelectric constants, when they are calibrated from experimental data. To illustrate the uncertainty propagation techniques, we will demonstrate the construction of 95% prediction intervals for PZT models at a given applied field.

As part of the tutorial, participants will have the opportunity to run case studies using MATLAB, if they have a local license on their laptop. These studies will include models and data provided by the instructors, but participants are also encouraged to bring their own models and data for testing during the tutorial, based on their specific problem(s) of interest. All tutorial code will be available online for later use by participants not having a local MATLAB license.

This introductory tutorial is intended for graduate students, industrial practitioners, and academic professionals who are interested in quantifying uncertainty in material and structural models in light of experiments or higher fidelity model predictions.

The tutorial is open to all registered attendees on a first-come first-serve basis. Seating is limited.

Liwu Liu, Jinrong Li, Fengfeng Li, Xiongfei Lv, Xin Lan, Yanju Liu, Jinsong Leng, Harbin Institute of Technology (China)

This demonstration will show smart polymers in action taking advantage of their being light weight, fast response, and large deformation. These advantages make them attractive for applications in smart bionics, aerospace, biomedicine and other fields. The demonstration will include the applications of EAP, shape memory polymer (SMP) and pneumatic artificial muscle (PAM), such as soft robot, soft continuum manipulator, smart release device, adaptive eyewear frame and other deformable structures.

DEA-driven vibratory feeder

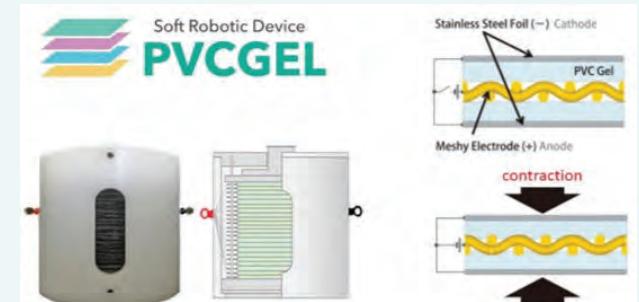

Steffen Hau, Mathias Hoffmann, Stefan Seelecke, Saarland Univ. (Germany)

Vibratory feeders are widely used in part handling technology for transport, aligning and/or feeding parts to a certain process. Currently they are driven by electro-magnetic actuators and unbalance motors, which do not allow arbitrary vibration profiles or changes of amplitude / frequency during operation. Dielectric elastomer actuator (DEA) show potential to overcome these drawbacks. A fully functional DEA driven vibratory feeder transporting small goods will be demonstrated, showing DEAs potential in this new field of application. Picture is showing a CAD model of the feeder consisting of transport channel (grey) with four actuator modules underneath.

Multilayered contraction type PVC gel actuator was developed using stainless mesh electrodes having many positive characteristics. This include being soft and lightweight, with stable actuation in air and with high output. It is activated by applying voltage of 400V, and the displacement of 60-layer artificial muscles is ~3.0mm, with contraction strain of ~10%, and the maximum output force is ~50kPa. The response rate is 9Hz, and the current is about 0.45mA.

Electrically tuning transparency by wrinkling of ZnO/Ag thin film

Milan Shrestha, Rosmin Elsa Mohan, Anansa Ahmed, Anand Asundi, Gih-Keong Lau, Nanyang Technological Univ. (Singapore)

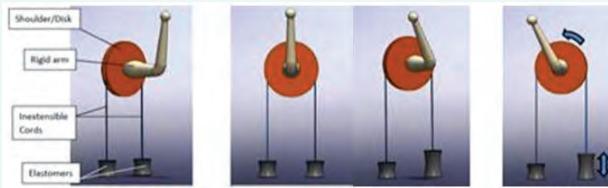

This demonstration unit consists of transparency tunable device. It works based on wrinkling and unfolding a ZnO/Ag-coated elastomer substrate using a dielectric elastomer actuator (DEA). Initially, the membrane is at wrinkled state and the device is opaque. An object placed underneath the membrane will not be visible. When the DEA device is electrically activated, the wrinkles are flattened turning the device to a transparent membrane and the object placed behind the device becomes clearly visible. Reversible tuning between the two states can be obtained electrically for a large number of cycles.

A stackable and configurable antagonistic actuator system for a wrestling arm

Koh Soo Jin Adrian, Stoyan Smoukov, Ang Marcelo H. Jr., Vy Khanh Vo Tran, Anup Teejo Mathew, Lionel Chong, Lester Leong, National Univ. of Singapore (Singapore) and Cambridge Univ. (United Kingdom)

19TH ANNUAL EAP-IN-ACTION SESSION AND DEMONSTRATIONS

Two stackable loudspeaker-type dielectric elastomer actuator (DEA) modules which have continuous-tunable movement by voltage will be demonstrated. When voltage is continuously switched between two DEA modules, the linear motion will be transferred to the controllable rotation of the arm with the extra mechanical design. During operation, a voltage is applied across the elastomer on the right, causing it to expand and "relax". The elastomer on the left contracts due to tension in itself, pulling on the disc and rotating the arm anti-clockwise. No voltage is applied across the left elastomer. The force exerted by the left elastomer is determined by the pre-stretching done mechanically. A discharge circuit also be included to remove the charge stored in DE membrane immediately once turning off voltage to get faster actuation, hence increases the power for the arm.

PetaPicoVoltron: an open-source portable high-voltage supply

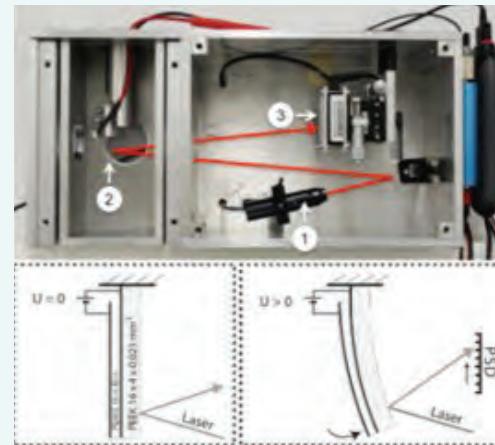

Samuel Rosset and Samuel Schlatter, EPFL (Switzerland)

A portable high voltage power supply (HVPS) will be demonstrated that is specifically designed to drive DEAs. Its output DC voltages is up to 5kV with a resolution of 0.1% of full scale, and can generate square signals from 1mHz to 1kHz with a slew rate faster than 15V/ μ s. It has a user friendly GUI enabling easy interaction with the HVPS, and using LabView library makes it simple to integrate the power supply with other instruments. The circuit layout and the software have been released as an open-source project, for anyone to use and improve.

Apparatus for measuring the actuation forces of DEAs via cantilever bending

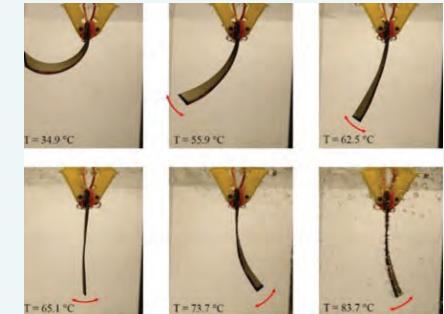

Bekin Osmani, Tino Topper, Burt Miller, Univ. of Basel (Switzerland)

A compact, simple-to-operate apparatus for measuring the generated forces of planar dielectric elastomer actuators (DEA) will be demonstrated. DEA structures are fabricated on top of a cantilever substrate material with well-known mechanical properties such as PEN, PEEK, or Kapton film. When a DC-voltage is applied to the planar electrodes on either side of the elastomer layer, the resulting deformation of the incompressible elastomer bends the cantilever. The bending curvature is measured by the deflection of a laser beam reflected from the cantilever onto a position sensitive detector. This cantilever system can be used to evaluate the maximal strains of single- as well as multilayer DEAs. Light from a laser (1) reflects off from a DEA-based cantilever (2). When a DC-voltage is applied, the cantilever bends (bottom schematic). A position sensitive detector (3) measures the resulting deflection of the laser beam.

Development of an origami soft robot using multiple shape memory ionic polymer-metal composite

Qi Shen, Sarah Trabia, Tyler Stalbaum, Taeseon Hwang, Robert Hunt, Zakai Olsen, Kwang Kim, Univ. of Nevada, Las Vegas (USA)

The multiple-shape-memory ionic polymer-metal composite (MSM-IPMC) actuator is used to demonstrate complex 3D deformation. The MSM-IPMC has two characteristics, which are the electro-mechanical actuation effect and the thermal-mechanical shape memory effect. The bending, twisting, and oscillating motions of the actuator could be controlled simultaneously or separately by means of thermal-mechanical and electro-mechanical transactions. Using the MSM-IPMC, a soft biomimetic robot was developed that has origami structure. The multiple shape memory effect enables the robot to change its shape and in return enables the robot to move forward in water. This work may bring inspiration for designing new soft robotic systems with the MSM-IPMC actuators.

Synthetic Muscle: shape-morphing and sensing EAP-based materials and actuators

Lenore Rasmussen, Ras Labs LLC (USA)

The operation of the latest Synthetic Muscle™ based actuators will be demonstrated. These are actuators that contract and expand, attenuate impact, and sense pressure. Actuation will be performed underwater, on land with suitable elastomeric coatings, and impact (mechanical pressure) resistance demonstrated. Hidemitsu Furukawa,
Yamagata Univ. (Japan)

TENTATIVE DEMONSTRATIONS:

The flexibility controlling study for 3D printed splint

Jianyou Li, Hiroya Tanaka, Keio Univ. (Japan)

The concept of 3D printed splint appeared in few years ago, and its light weight and ventilation can improve the comfortableness for patients. In this study, two main techniques to control the infilling densities and printing temperature are applied on printing splint prototype. The gradual increasing of infilling density from splint outside to inside would turn the partial strength from hard to flexible. Besides, higher printing temperature can also achieve stronger hardness after cooling. Such structural can provide high strength in outside surface to keep the immovable function, and give flexible touch of inside surface to decrease friction on the patient's skin.

3D printing and IoT for personalized everyday objects in nursing and healthcare

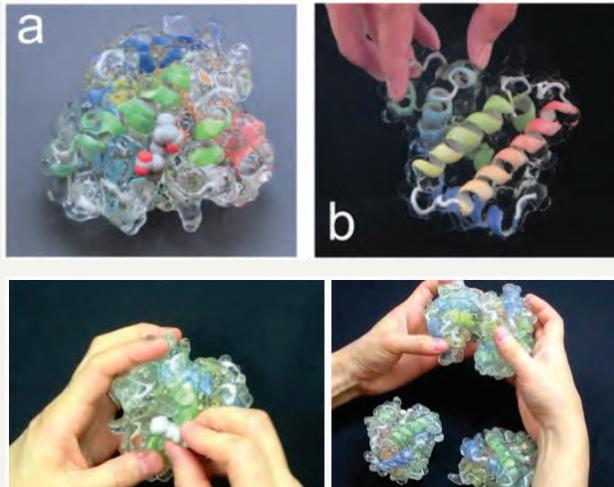

Yoshihiro Asano, Hiroya Tanaka, Shoko Miyagawa, Junki Yoshioka, Keio Univ. (Japan)

Today, 3D printing in medical use are mainly focusing on the symptom itself, not on everyday lives of patients. However, with life span extending, many of us will live a life with chronic disease for long time. To support their lives, we use 3D printing for making

everyday objects from a nursing / healthcare perspective. In our project, we invited many kinds of people such as engineers, nurses and patients to our research activity and found methodologies for collaboration. Also we're developing the IoT sensing system, which monitor activities of 3D printed objects remotely.

3D printing of protein molecules

Masaru Kawakami, Hidemitsu Furukawa, Yamagata Univ. (Japan)

Protein molecules play many critical roles in our body. They have large and complex structures, and understanding of the relationship between their structures and biological functions is a crucial key for biology and medicines. At the present, to conceptualize structures of proteins, we rely on computer graphics of their three-dimensional (3D) structure. On the other hand, physical models can convey "intuitive" understanding, and that is really useful for education and even for peer discussion. The first author Kawakami invented a new molecular model called "Kawakami model", which is a soft, transparent handleable model, can be fabricated by 3D printing and transparent silicone resin. A full-color printed amino acid chain structure is embedded in the silicone body. The silicone body represents the molecular surface of a protein molecule. Users can simultaneously feel the molecular surface, view through the main chain structure, and even manually simulate molecular docking. This model is already commercialized and available upon request. So far many Kawakami models have already been shipped and being used as effective discussion tools for the classroom/laboratory, exhibition in museums/institutes, and outreach activities. In this session, some Kawakami models will be presented, and demonstration of "hands-on" protein-ligand docking and protein-protein interaction will be performed.

Smart walking stick for blind people: an application of 3D printer

Faidur Rahman, Md. Allama Iqbal, Univ. of Rajshahi (Bangladesh); Md. Hasnat Kabir Hidemitsu Furukawa, Yamagata Univ. (Japan)

A prototype of the smart walking stick has been designed and characterized for the people who are visually impaired. The proposed system was designed into two stages, i.e. hardware and software. Two ultrasonic sonar sensors were used to detect in front obstacle and street surface obstacle such as a manhole. The distance between sensor and the obstacle is calculated by the received signal. The calculated distance value is compared with the pre-defined value and determines whether the obstacle is present or not. An Up-Mini 3D printer was used to print the sensor holders which were mounted on the walking stick. Therefore, the sensors were fixed in the right position. Another sensor was used for the detecting the water on the walking street. The performance for detecting the obstacles and water indicate the merit of the smart walking stick.

3D gel printing and applications

Kazuyuki Sakai, Masato Wada, Kyuuichiro Takamatsu, Azusa Saito, Ajit Khosla, Masaru Kawakami, Hidemitsu Furukawa, Yamagata Univ. (Japan)

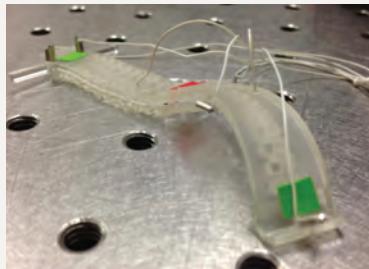

We have developed 3D gel printer from 8 years ago. Around two thousand years ago, high strength gels were invented by Japanese researchers. However, it was difficult to process high strength gels (Fig. 1), because gel is soft material and complex synthesis procedures are needed. In SWEL, we develop a new type of high strength gels (ICN4, P-DN5), which can be used for 3D gel printer. Furthermore, we developed two types of 3D gel printer, "Bathtub type" and "Dispenser type" in Strategic Innovation promotion Program (SIP) supported by cabinet office, government of Japan. Figure 2 shows 3D models made by high strength gels. Not only 3D gel printer, we have studied another processing methods using laser cutter, using mold. Figure 3 shows 3D gel printers. Another side of important specific of high-strength gel is low friction. Taking this advantage, we have studied gel-sheet, gel-O-ring, and so on. The apparatus of Fig.4 is gel friction meter to measure friction and/or toughness of the gel. This is also supported by the national project named "Green Tribology Innovation Network" in the area of Advanced Environmental Materials, Green Network of Excellence (GREENE). We will show samples made by high strength gels in the demo session.

3D PRINTING DEMONSTRATION SESSION

Caterpilike: a soft-bodied 3D printed robot inspired by caterpillars

Takuya Umedachi, The Univ. of Tokyo (Japan)

Caterpilike is a soft-bodied 3-d printed robot inspired by caterpillars. Caterpillars are excellent living models to extract the mechanical and control design principles for soft-bodied robots, since they produce adaptive and resilient behaviors by orchestrating the large degrees of freedom in

their bodies (no explicit skeletons) with small numbers of neurons. Compared with traditional robotic systems consisting of hard-rigid components, the robot generates crawling locomotion driven by a few actuators by exploiting the continuum large-deformation of the soft material. We believe that such body design is important to endow a robotic system to have high an affinity with our living and natural environments.

3D printing in social education: Eki-Fab and student PBL

Masato Makino, Azusa Saito, Mai Kodama, Kyuuichiro Takamatsu, Hideaki Tamate, Kazuyuki Sakai, Masato Wada, Ajit Khosla, Masaru Kawakami, Hidemitsu Furukawa, Yamagata Univ. (Japan)

Additive manufacturing or 3D printer is one of the most innovative material processing methods. We are considering that 3D printing human resources would be needed in the world in the future. To educate the abilities of the digital fabrication, we have the public digital space "Eki-Fab" for junior and high school students and Project Based Learning (PBL) class for bachelor course students. Eki-Fab is held on Saturday in the 2nd floor of the Yonezawa train station. In the "Eki-Fab", anybody can study the utilizing of 3D printer and its related modeling technics under the instruction of staff in Yamagata University. In the PBL class, we have the class every Thursday. The students get the techniques of the digital fabrication through the PBL.

3D printing for food

Mai Kodama, Azusa Saito, Masato Makino, Ajit Khosla, Masaru Kawakami, Hidemitsu Furukawa, Yamagata Univ. (Japan)

We have been developing a new food by using the 3D printer in cooperation with local companies. Now, we would like to introduce two types of new products was realized in this effort as shown in Fig.1 and Fig.2. Fig.1 is a jelly with the form of a carp. This jelly is melted if you soak it in the hot water, so you can eat it as a soup. Fig. 2 is a jelly with the form of a lantern. Since this jelly does not melt even at high temperatures, you can eat as warm jelly. These jellies were formed by molds made by using the 3D printer as shown in Fig. 3. We made the jellies with the form of a carp and a lantern, because locals likes carps and lanterns. Carp has been eaten for a long time following economical instructions of the then governor. Because our local area receives a lot of snow in the region, there is a festival to make a lot of snow lanterns. If the practical application of the 3D printer is advanced, everyone can make the original food easily, and everyone may enable obtaining enjoyment of eating.

3D printing of wearable fractal based sensor systems for neurocardiology and healthcare

Vijay K. Varadan, Mouli Ramasamy, The Pennsylvania State Univ. (USA)

Neurocardiology is the pathophysiological interplay of nervous and cardiovascular systems. The communication between the heart and brain has revealed various methodologies in healthcare that could be investigated to study the heart-brain interactions and other cardiovascular and neurological diseases. A textile-based wearable nanosensor system in the form of e-bra, e-shirt, e-headband, e-brief, underwear etc., was presented in SPIE conferences earlier for noninvasive recording of EEG and EKG, and showing the correlation between the brain and heart signals. In this paper, the technology is expanded further using fractal based geometries using 3D printing system for low-cost and flexible wearable sensor systems for healthcare.

Demonstration Session

Moderator : Yoseph Bar-Cohen, Jet Propulsion Lab. (USA)

This session highlights some of the latest capabilities and applications of Electroactive Polymers (EAP) materials where the attendees are shown demonstrations of these materials in action. Also, the attendees interact directly with technology developers and given "hands-on" experience with this emerging technology. The first Human/EAP Robot Armwrestling Contest was held during this session of the 2005 EAPAD conference.

Acceptance of Policies and Registration Conditions

The following Policies and Conditions apply to all SPIE Events. As a condition of registration, you will be required to acknowledge and accept the SPIE Registration Policies and Conditions contained herein.

Granting Attendee Registration and Admission

SPIE, or their officially designated event management, in their sole discretion, reserves the right to accept or decline an individual's registration for an event. Further, SPIE, or event management, reserves the right to prohibit entry or remove any individual whether registered or not, be they attendees, exhibitors, representatives, or vendors, who in their sole opinion are not, or whose conduct is not, in keeping with the character and purpose of the event. Without limiting the foregoing, SPIE and event management reserve the right to remove or refuse entry to any attendee, exhibitor, representative, or vendor who has registered or gained access under false pretenses, provided false information, or for any other reason whatsoever that they deem is cause under the circumstances.

SPIE Safe Meeting and Misconduct Policy

SPIE is a professional, not-for-profit society committed to providing valuable and safe conference and exhibition experiences. SPIE is dedicated to equal opportunity and treatment for all its members, meeting attendees, staff, and contractors. Attendees are expected to be respectful to other attendees, SPIE staff, and contractors. Harassment and other misconduct will not be tolerated; violators will be addressed promptly and seriously. Consequences up to and including expulsion from the event as appropriate will be implemented immediately.

The SPIE anti-harassment policy can be found at <http://spie.org/policy>.

Reporting of Unethical or Inappropriate Behavior

SPIE is an organization with strong values of responsibility and integrity. Our Harassment Policy, Ethics Statement, and Code of Professional Conduct contain general guidelines for behavior and for conducting business with the highest standards of ethics.

Onsite at a SPIE meeting, contact any SPIE Staff member with concerns or questions for thorough follow-up. If you feel in immediate danger, please dial 911 for police intervention.

SPIE has established a confidential reporting system for staff and all meetings participants to raise concerns about possible unethical or inappropriate behavior within our community. Complaints may be filed by phone at +1-888-818-6898 or at www.SPIE.ethic-spoint.com and, if preferred, may be made anonymously.

Identification

To verify registered participants and provide a measure of security, SPIE will ask attendees to present a government-issued Photo ID at registration to collect registration materials.

Individuals are not allowed to pick up badges for attendees other than themselves. Further, attendees may not have some other person participate in their place at any conference-related activity. Such other individuals will be required to register on their own behalf to participate.

Access to Technical and Networking Events

All technical and networking events require a conference badge for admission. Registered attendees may bring their children with them as long as everyone is badged. Registration badges for children under 18 are free and available at the SPIE registration desk onsite. Children under 14 years of age must be accompanied by an adult at all times, and guardians are asked to help maintain a professional, disturbance-free conference environment.

Exhibition Hall Policy

Everyone who attends the exhibition must be registered and have a badge. Badges for children are free and available onsite at the registration desk. Children under 14 years of age must be accompanied by an adult at all times. Guardians are asked to help maintain a professional, disturbance-free exhibition environment. For safety and insurance reasons, children under 18 are not allowed in the exhibition area during exhibition move-in and move-out.

Payment Method

Registrants for paid elements of the event, who do not provide a method of payment, will not be able to complete their registration. Individuals with incomplete registrations will not be able to attend the conference until payment has been made. SPIE accepts VISA, MasterCard, American Express, Discover, Diner's Club, checks and wire transfers. Onsite registrations can also pay with Cash.

Authors/Coauthors

By submitting an abstract, you agree to the following conditions:

- An author or coauthor (including keynote, invited, and solicited speakers) will register at the author registration rate, attend the meeting, and make the presentation as scheduled.
- A manuscript (minimum 6 pages, maximum 20 pages) for any accepted oral, invited, keynote, or poster presentation will be submitted for publication in the *Proceedings of SPIE* in the SPIE Digital Library. Some SPIE events have other requirements that the author is made aware of at the time of submission.
- Only papers presented at the conference and received according to publication guidelines and timelines will be published in the *Proceedings of SPIE* in the SPIE Digital Library (or via the requirements of that event).

Audio, Video, Digital Recording Policy

Conferences, courses, and poster sessions: For copyright reasons, recordings of any kind are prohibited without prior written consent of the presenter or instructor. Attendees may not capture or use the materials presented in any meeting/course room or in course notes on display without written permission. Consent forms are available at Speaker Check-In. Individuals not complying with this policy will be asked to leave a given session and/or asked to surrender their recording media.

EXHIBITION HALL: For security and courtesy reasons, recordings of any kind are prohibited unless one has explicit permission from on-site company representatives. Individuals not complying with this policy will be asked to surrender their recording media and to leave the exhibition hall.

Capture and Use of a Person's Image

By registering for an SPIE event, I grant full permission to SPIE to capture, store, use, and/or reproduce my image or likeness by any audio and/or visual recording technique (including electronic/digital photographs or videos), and create derivative works of these images and recordings in any SPIE media now known or later developed, for any legitimate SPIE marketing or promotional purpose.

By registering for an SPIE event, I waive any right to inspect or approve the use of the images or recordings or of any written copy. I also waive any right to royalties or other compensation arising from or related to the use of the images, recordings, or materials. By registering, I release, defend, indemnify and hold harmless SPIE from and against any claims, damages or liability arising from or related to the use of the images, recordings or materials, including but not limited to claims of defamation, invasion of privacy, or rights of publicity or copyright infringement, or any misuse, distortion, blurring, alteration, optical illusion or use in composite form that may occur or be produced in taking, processing, reduction or production of the finished product, its publication or distribution.

Laser Pointer Safety Information/Policy

SPIE supplies tested and safety-approved laser pointers for all conference meeting rooms. For safety reasons, SPIE requests that presenters use provided laser pointers.

Use of a personal laser pointer represents user's acceptance of liability for use of a non-SPIE-supplied laser pointer. If you choose to use your own laser pointer, it must be tested to ensure <5 mW power output. Laser pointers in Class II and IIIa (<5mW) are eye safe if power output is correct, but output must be verified because manufacturer labeling may not match actual output. Come to Speaker Check-In and test your laser pointer on our power meter. You are required to sign a waiver releasing SPIE of any liability for use of potentially non-safe, personal laser pointers. Misuse of any laser pointer can lead to eye damage.

Unauthorized Solicitation Policy

Unauthorized solicitation in the Exhibition Hall is prohibited. Any non-exhibiting manufacturer or supplier observed to be distributing information or soliciting business in the aisles, or in another company's booth, will be asked to leave immediately.

Unsecured Items Policy

Personal belongings should not be left unattended in meeting rooms or public areas. Unattended items are subject to removal by security. SPIE is not responsible for items left unattended.

Wireless Internet Service Policy

At SPIE events where wireless is included with your registration, SPIE provides wireless access for attendees during the conference and exhibition but cannot guarantee full coverage in all locations, all of the time. Please be respectful of your time and usage so that all attendees are able to access the internet.

Excessive usage (e.g., streaming video, gaming, multiple devices) reduces bandwidth and increases cost for all attendees. No routers may be attached to the network. Properly secure your computer before accessing the public wireless network. Failure to do so may allow unauthorized access to your laptop as well as potentially introduce viruses to your computer and/or presentation. SPIE is not responsible for computer viruses or other computer damage.

Mobile Phones and Related Devices Policy

Mobile phones, tablets, laptops, pagers, and any similar electronic devices should be silenced during conference sessions. Please exit the conference room before answering or beginning a phone conversation.

Smoking

For the health and consideration of all attendees, smoking, including e-cigarettes, is not permitted at any event elements, such as but not limited to: plenaries, conferences, workshops, courses, poster sessions, hosted meal functions, receptions, and in the exhibit hall. Most facilities also prohibit smoking and e-cigarettes in all or specific areas. Attendees should obey any signs preventing or authorizing smoking in specified locations.

Hold Harmless

Attendee agrees to release and hold harmless SPIE from any and all claims, demands, and causes of action arising out of or relating to your participation in the event you are registering to participate in and use of any associated facilities or hotels.

Event Cancellation

If for some unforeseen reason SPIE should have to cancel the event, registration fees processed will be refunded to registrants. Registrants will be responsible for cancellation of travel arrangements or housing reservations and the applicable fees.

"The instructor was skilled and clear in his presentation. In contrast to some other courses I have taken there is value in using the higher definition of the videos where the video is available as the presenter actually gestures and contributes to the presentation."
